AI ENVOY SPHERE

V.6

Data Envoys

Practical use of Data & AI in business

Data Envoys is a team of experts in artificial intelligence, data and technological innovation. The company supports organizations in designing and deploying data and AI solutions, building a business advantage with next-generation technologies.

Unlock new levels of innovation and efficiency, turning your digital journey into a world of limitless possibilities.

Expertise

AI, data, solution architecture, infrastructure and security.

Experience

Dozens of successful projects. Hundreds of Data & AI training sessions

Business value

Products and expertise that support managers and specialists.

Growth

Continuous improvement and innovation ahead of market needs.

Partnership

Collaboration, transparency, accountability and an ethical approach to AI.

DATA ENVOYS

Team DATA ENVOYS

Strategy, architecture and implementation experience in Data & AI projects

Andrzej Wyszomierski

CEO | Data & AI Strategy | Governance Architect

Combines business, technology and regulatory perspectives in Data & AI projects.

Helps organizations develop AI strategies, data architectures, operating models and governance.

Experience gained in numerous leadership roles and dozens of projects across sectors including banking, energy, pharmaceuticals and manufacturing.

Łukasz Piotrowicz

Co-founder | Data & AI Strategy | Solution Architect

Specializes in aligning business goals with Data & AI solution architecture.

Guides clients from discovery and Proof of Value to MVP and production deployments.

Extensive experience in BI, Data Platforms, Machine Learning, AI Agents and projects built on Azure, Fabric, Power BI, Snowflake and Databricks.

Przemysław Rosłon

Co-founder | Azure & Software Architect

Expert in application architecture, Microsoft Azure, SQL Server and AI services.

Designs scalable and secure systems, combining implementation expertise with training and academic experience.

Delivered numerous technology projects involving applications, databases, cloud and AI solutions for business clients.

Extensive experience in Azure Cloud, Data Platforms, BI, AI, Governance, solution architecture and dozens of implementation projects for enterprise clients.

AI challenges in organizations

Scaling AI across an organization requires control, security and an operational governance model.

Tool sprawl

Fragmented AI tools, experiments and data without a common deployment standard.

Lack of trust in results

Unsourced answers, unclear risks and no quality control.

Democratizing AI

AI should reach a broad employee base, without losing control.

Shadow AI

Unauthorized tools create data and compliance risks.

No control over costs

Tokens, infrastructure and budgets need constant oversight.

Business integrations

Agents must work with business knowledge, systems and processes.

Low adoption

Many AI deployments fail. Rollouts are slow and changes are costly.

Competition

Competitors never sleep, they experiment and deploy. Only the best will survive!

AI Envoy Sphere streamlines the full AI agent lifecycle: from knowledge, configuration and publishing, to monitoring, security and ROI.

Value proposition

One platform for building agents and councils powered by AI (digital twins), combining the power of models, knowledge bases and skills with enterprise-grade control.

From a single chat...

fragmented models, files, experiments, inconsistent policies and limited cost visibility.

AI ENVOY SPHERE

...to a managed studio for AI agents

- Governance
- AI Studio
- Model deployment
- Building agents, councils, apps
- Bases of knowledge and skills
- Quality and evaluations
- Workflow
- Publishing channels
- Security, administration
- ROI, risk, costs and adoption

Customer outcome – a competitive edge through the use of an organizational digital twin in everyday business interactions.

Faster transition from PoC to production, stronger security, measurable ROI and the ability to build many specialized agents and councils powered by AI for different business areas.

Business benefits

Build a competitive edge with a digital twin of your business and AI agent councils.

Faster automation

Streamline processes and accelerate access to answers, knowledge and decisions.

Higher productivity

Support teams with agents and councils powered by AI via chat and voice, when working with files and images.

Security and compliance

A secure AI platform on your Azure infrastructure. Roles, policies, filters for content and logs.

Democratizing AI

Create, test, deploy and share agents and AI applications across the entire organization at a scale that fits your needs.

Customer outcome

AI ENVOY SPHERE enables companies to build digital twins and digitize expert teams by combining multi-agent orchestration, corporate knowledge, external information, security, integrations and governance in one environment.

How AI Envoy Sphere supports your organization

Platform use cases for working with knowledge, documents, processes and AI agents.

Secure access to multiple AI models

Access to multiple language models (LLM) from a single managed environment, with access control, cost and chat history monitoring, and security policies. Use of generative models for **text, audio, images, video**

AI assistants answering based on company knowledge

Agents using documents, procedures, instructions, SharePoint, files, knowledge bases and other data sources to provide fast and reliable answers for employees

Document analysis and processing

Analysis of contracts, requests for proposals (RFP), proposals, invoices, regulations and technical documentation, with automated summaries, recommendations and identification of risks. Processing large datasets.

Creating document fact sheets

Easy extraction of structured facts from documents and data sources. Further analysis by agents or export to a file for combining with other data.

Business process automation

Integration with enterprise systems and execution of business actions using Microsoft Logic Apps, N8N, API and other integration mechanisms. Prototyping applications and calculators directly in chat and deploying them to production.

Extending agents with specialized capabilities (Skills)

Enhancing agents with capabilities to search for information, perform operations in business systems, use external services, launch processes or communicate with company applications.

Multi-agent AI collaboration

Creating processes based on multi-agent orchestration, including sequential and parallel collaboration, task delegation, planning and dynamic coordination of actions.

AI Agent Councils (AI Agent Councils)

Building teams of specialized AI agents that collaborate like experts from different fields, jointly analyze problems, hold discussions and develop recommendations or business decisions.

Digital twins of experts, teams and organizations

Creating digital representations of specialists, departments and entire business functions, reflecting how people collaborate and supporting complex processes and decision-making across the enterprise

AI quality and compliance management

Monitoring response quality, costs, model usage, risks and compliance with organizational policies. Analysis of chat history, errors and user ratings, and continuous improvement of AI agents.

Selected capabilities of the platform

From knowledge bases and RAG, through orchestration across agents, integrations, to governance, security, costs and publishing channels.

Creating agents and applications

- Configuring models, prompts, response styles, skills and parameters for AI
- Marketplace for agents, councils of agents and apps accessible via multiple channels: web, Teams, API, Microsoft Copilot and other messengers

Orchestration across agents

- Sequential, Concurrent, Handoff, Group Chat, Magentic, Graph workflow
- Delegating tasks among agents equipped with skills and company knowledge
- Agent harness and human in the loop

Knowledge for business (RAG)

- Indexing documents and data from various sources e.g.: SharePoint, Webscraper, API, LangChain Loaders
- Citations, scoring sources and monitoring chunks, tracing reasoning
- Automatic creation of facts and flashcards from documents for use by agents

Conversation and collaboration

- Chat, voice, transcription, image analysis. Agent collaboration history.
- Export results to PDF, DOCX, PPTX, XLSX
- Generative AI for text, audio, images, video

Deployments and integrations

- MCP servers, A2A, N8N, Logic Apps, Microsoft (Teams, Outlook, Copilot) Web Embed, REST API, Slack, Telegram, Discord
- Example model providers: OpenAI, Anthropic, xAI, DeepSeek, Meta, Mistral AI

Governance and analytics

- Dashboard for admins, reports on usage, quality, risk and ROI
- Automated and manual evaluation of performance by agents, alerts on quality and trail for audits
- AI system logs and health

Workspace for AI users

A place for daily work with AI agents and models.

Chatting with AI agents and councils

Chat with various agents on company data using LLM models, MCP servers and skills. Image responses. Question-writing assistant. Chat branching and restoration.

Chat history

View chat and agent activity history. Delete history entries. Continue a chat. Filter by type, deployment, model and date. Add to favorites.

Logic Apps and n8n workflows in chat

Run processes from chat – the agent can trigger predefined Azure Logic Apps and n8n workflows without leaving the conversation.

Access to company data

Select company sources. Add files to chat. Citations with links. Source list with scores. Preview data sources and specific document passages. Automatically use document summary cards to improve quality.

Response quality rating

Rate response quality and send a single response or the entire conversation to the business administrator.

Agent-to-Agent connections in chat

Delegate tasks to external agents – the agent can assign subtasks to other A2A-compliant agents.

Image and video creation

Generate and edit images and video. Access various image models. Select quality and resolution. Preview image editing steps. Advanced editing. Label content generated or modified by AI.

Advanced chat settings

Enable an additional menu with advanced model, search and chat settings to test their impact on response quality.

Automation

Define CRON schedules that automatically run one or more agents (classic chats).

Voice communication

Voice communication with an agent directly in chat. Listen to responses directly in chat.

Agent reasoning

View knowledge base chunks used by the agent (side panel, tile, explain and answer with timeline). View and export the agent execution pipeline.

Apps

Use text prompts to create interactive app mockups, calculators, videos, charts etc. Preview apps or code directly in chat.

Response styles

Use predefined response styles to control agent behavior. Styles are defined by the business administrator.

Visual agent execution plan

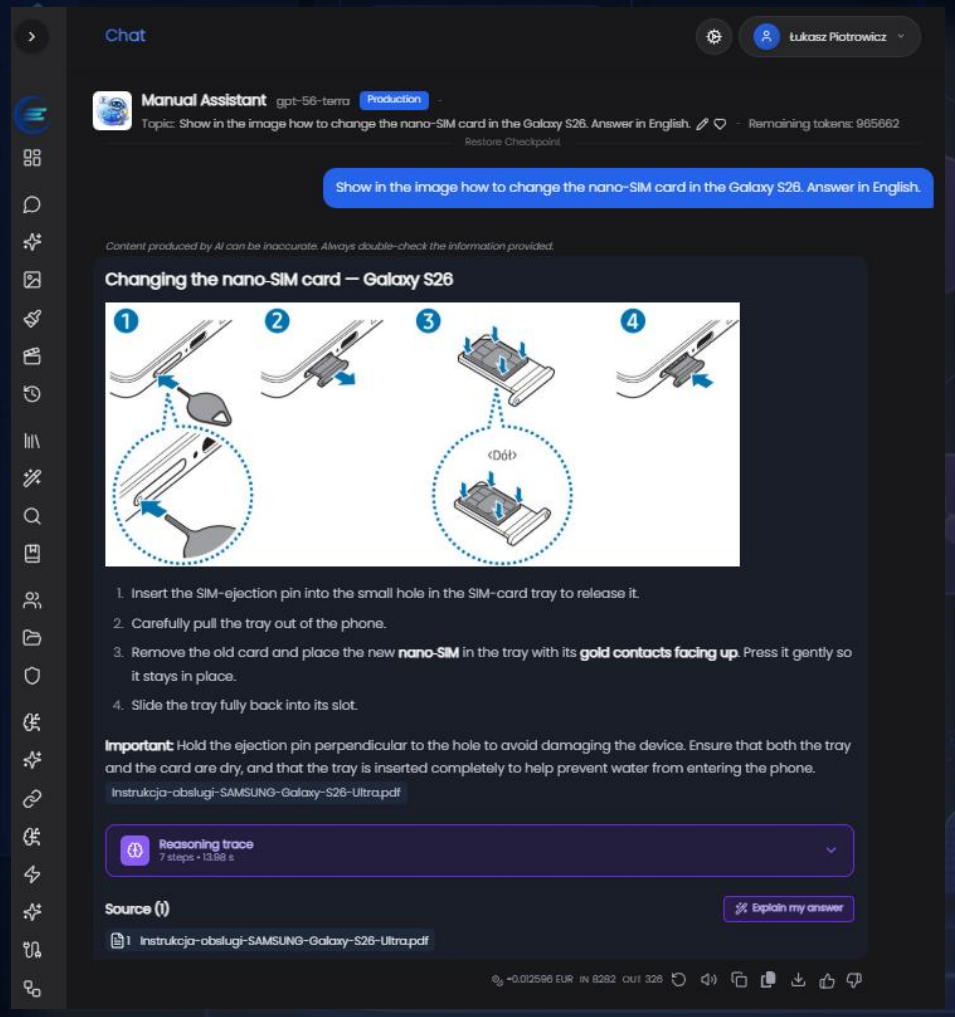

Agent action plan – visualize execution steps and download the diagram as PNG

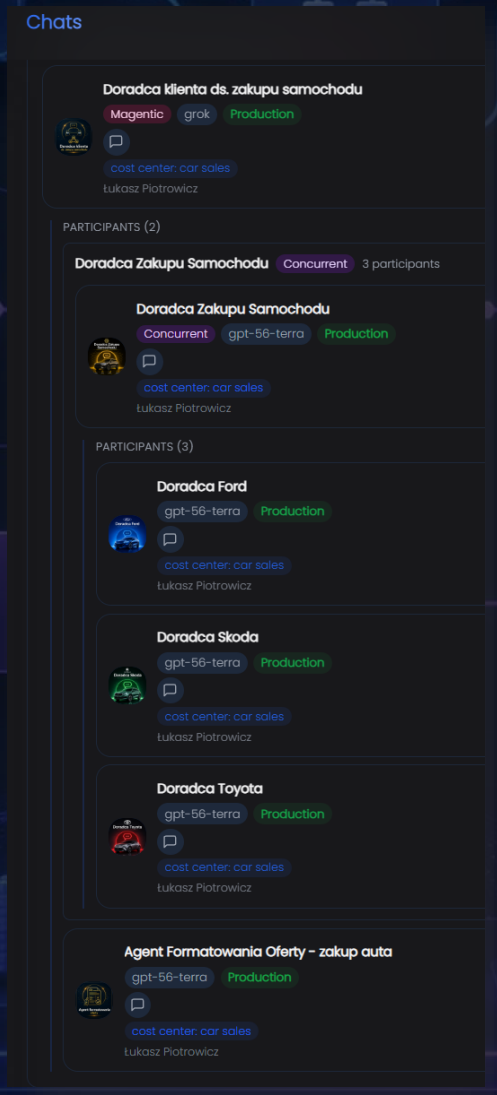

Other

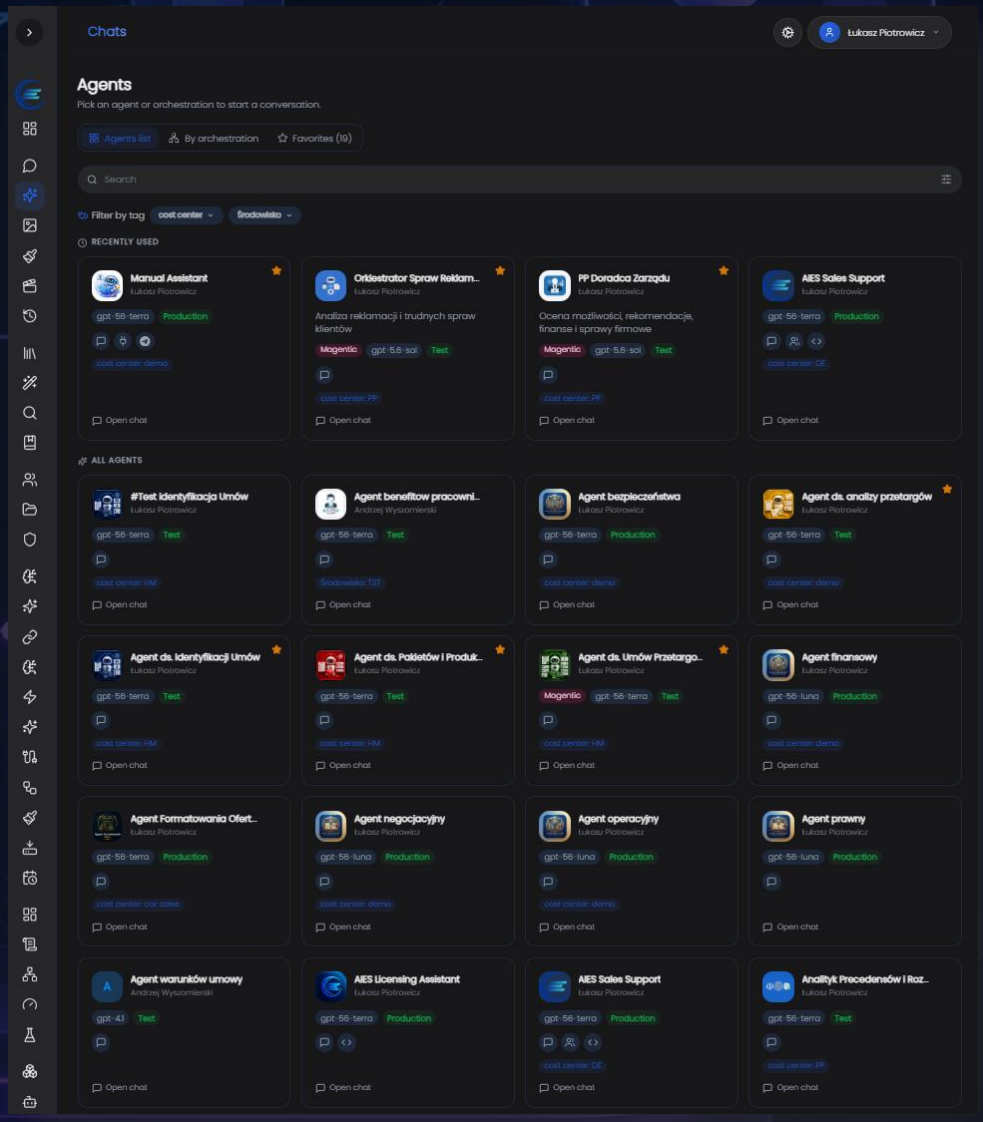

Copy information with or without formatting. View budget and token usage. Rename chats. Export chats to file formats (PDF, DOCX, XLSX, TXT, PPTX).

Workspace for AI users

A place for daily work with AI agents and models.

Create interactive apps, calculators and presentations

Create any app directly in chat, then share it.

File creation and editing

File operations with file output (Word / Excel / PowerPoint / PDF / CSV / Markdown). The agent returns a modified or new file for download.

Apps, calculators, mockups, charts

Use text prompts to create interactive app mockups, calculators, videos, charts etc. Live preview.

Sharing

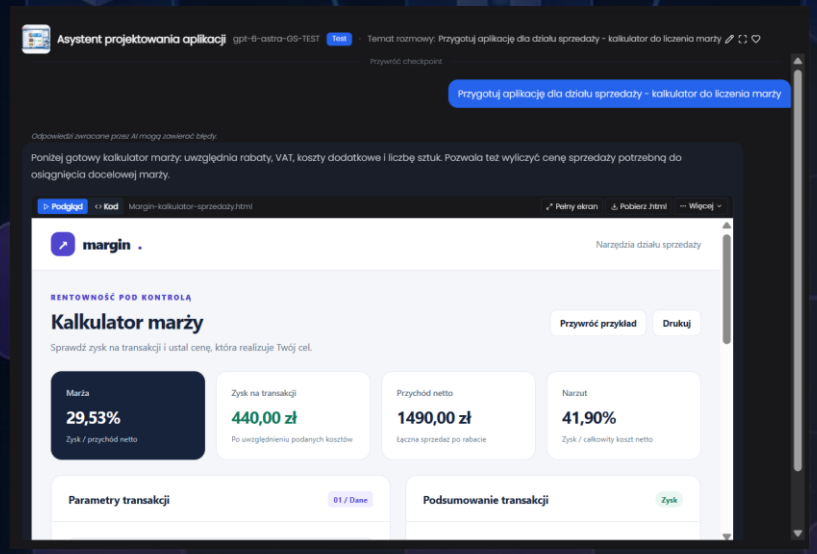

Download and copy .html. Publish and share the app link. Edit and run code in StackBlitx. Create an Azure Static Web Apps package.

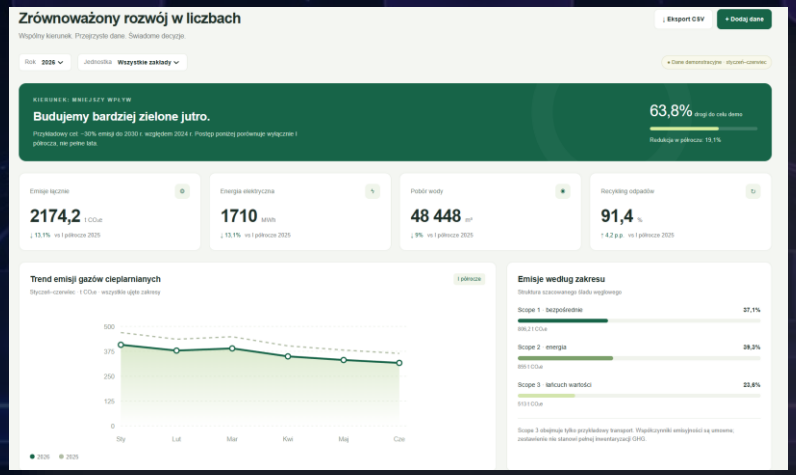

Web app browsing

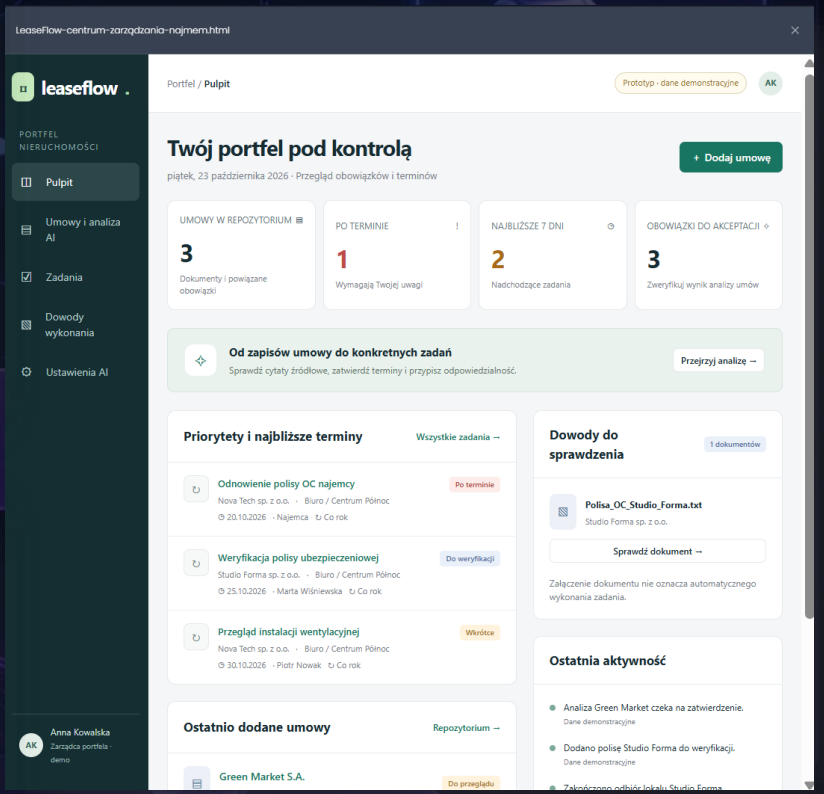

The agent controls a browser in the cluster: opens specified pages, reads tables and text, takes screenshots, clicks and navigates on its own in autonomous mode.

App marketplace (coming soon)

Share apps with employees according to role and permission policies. Share other AI-created artifacts

Model deployment

Deploy various models with a choice of pricing tier and capacity settings.

Chat models

Deploy various models based on LLM (e.g. OpenAI, Anthropic, xAI, DeepSeek, Meta, Mistral AI, Cohere, Fireworks). Add security policies and pricing tiers.

Embedding models

Deploy various embedding models to vectorize text. Set pricing tiers.

Image models

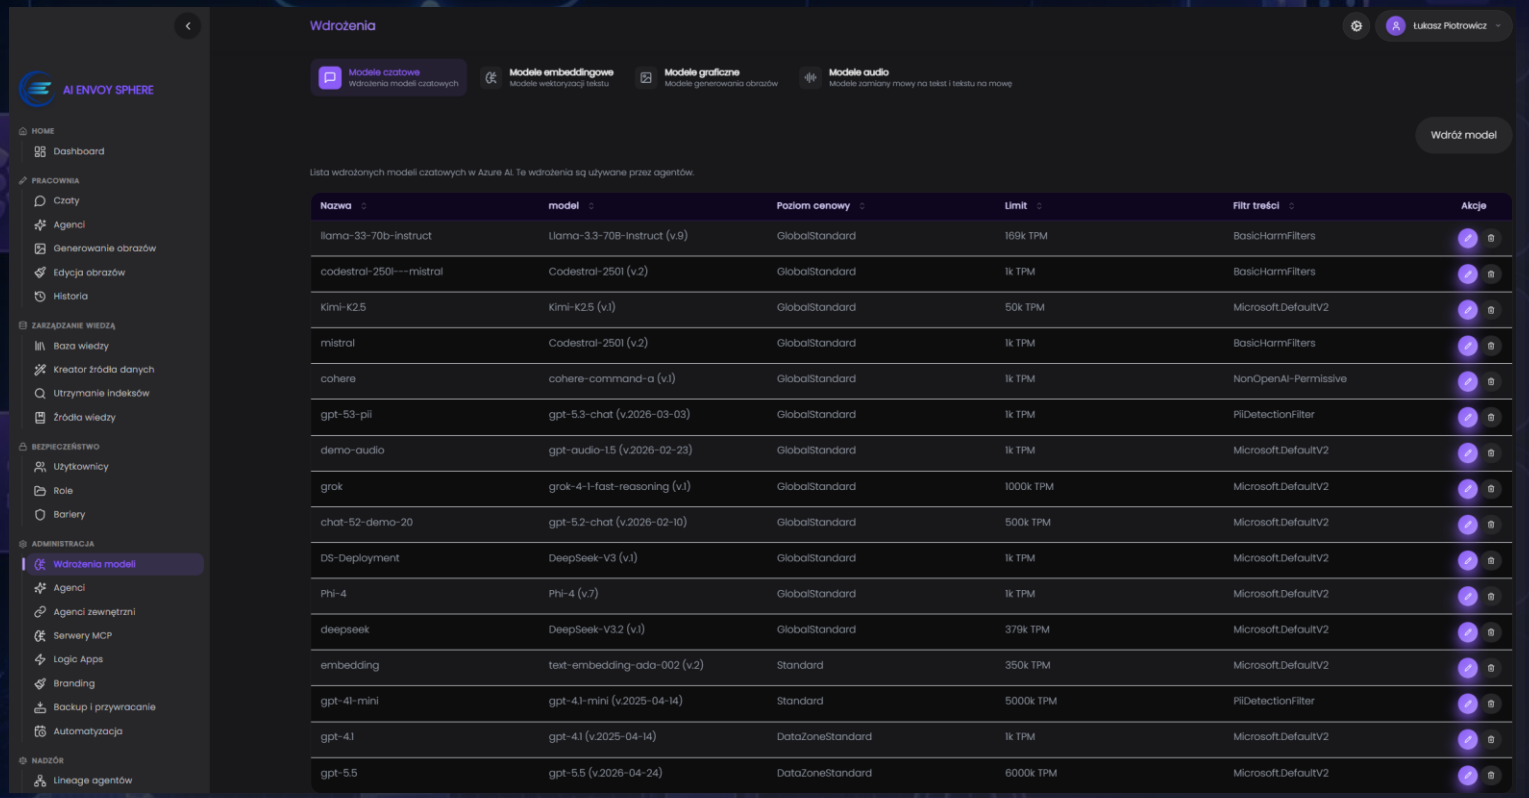

Deploy various image generation models. Set pricing tiers.

Audio models

Deploy various text-to-audio and audio-to-text models. Set pricing tiers.

Video models

Deploy various text-to-video models. Set pricing tiers.

External agents, MCP servers, Workflows, Skills

Enhance agents with additional skills and integrations.

External agent registration

Register and manage A2A-compliant external agents to which your agents can delegate tasks (Foundry, LangGraph, custom endpoints)

MCP models

Register external servers and tools compatible with Model Context Protocol. Access DockerHub, MCP Registry, Google, Foundry catalogs. Create custom MCPs

Azure Logic Apps, n8n integration

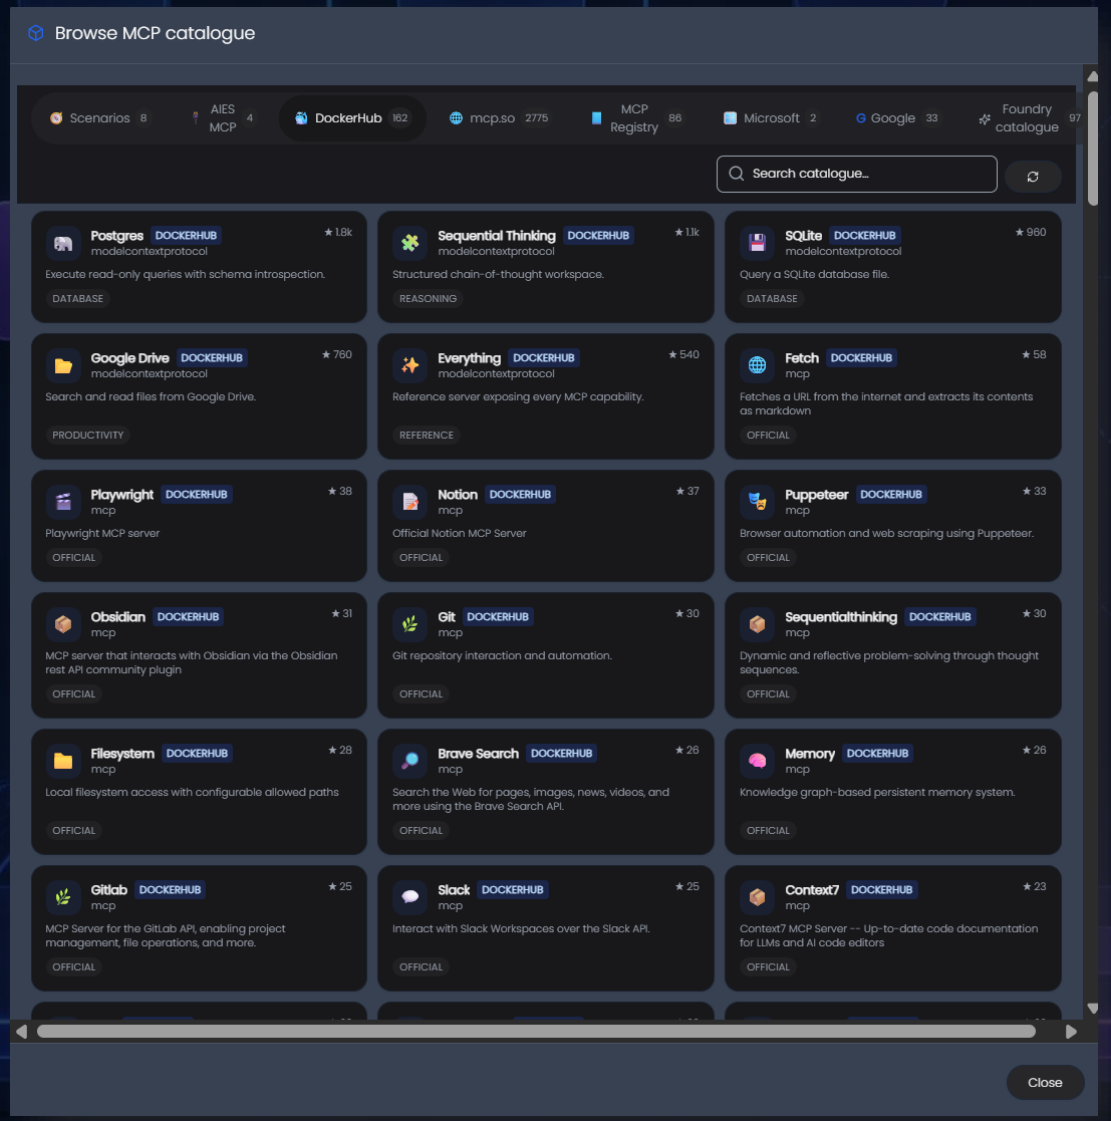

Register Azure Consumption Logic Apps with an HTTP Request trigger as skills for agents. Generate flows with AI. Connect to an n8n workflow automation instance

Automation, Pipelines

CRON schedules that automatically run one or more agents (classic chats). Deterministic workflows executed step by step within the platform.

Agent skills

Manage SKILL.md instruction packages loaded by agents during conversations. Generate skills with AI.

Creating and configuring agents

Create and configure agents ready for immediate use in business processes.

Basic configuration

Name, version, active status, icon, chat customization, LLM model, system prompt. System prompt creation assistant. Prompt history. Icon generation. Agent settings versioning. Agent cloning.

Image, audio and video

Configure image and video generation and editing in chat. Label AI content. Configure transcription from a microphone or file.

Chat export

Choose a file format to export a single response or the entire conversation (e.g.: PDF, DOCX, TXT, PPTX, XLSX)

AI configuration

Response styles, skills, dynamic LLM settings, maximum token count. Quick parameter presets. Model routing. Long-term memory. Compaction of context.

Multi-agent orchestration

Sequential pipeline, parallel execution, context-based delegation, manager-led discussion, dynamic coordination of specialized agents. Define graph workflows. External LangGraph.

Workflows

Connect registered Azure Logic Apps and n8n workflows to the agent. Design Logic App workflows using an AI assistant.

Search and knowledge

Add data sources, define source citation methods, search algorithms (text, vector, hybrid), configure history usage options, over a dozen search strategies. Post-processing of search results (LangChain).

External agents and MCP servers

Add registered MCP servers (DockerHub,MCP Registry, Google, Microsoft Foundry). Connect external agents to delegate subtasks (A2A).

Skills

Skills are reusable instruction packages (in SKILL.md style) registered by administrators. The agent sees only their names and descriptions; full content loads on demand.

Chunk monitoring

Full agent reasoning traces record each pipeline step with tokens and duration. Set the monitoring mode for knowledge base chunks (side panel, tile, explain and answer with a timeline).

Risk assessment, ROI and tags

Automatic calculation of savings with manual adjustment options. Key-value agent tagging. Human in the loop - tool approval. Support for risk management and compliance with selected obligations under the AI Act

Tool policies and agent harness

Create rules for runtime per agent from presets, AI suggestions or the agent's configured tools. Persistent task list, plan/execute mode and secure delegation to agents.

Publishing channels

Configure agent access channels e.g.: Teams, External Rest API, Web Embed widget, Outlook, Messenger, Telegram, WhatsApp, Discord, Slack). Make the agent available to clients using the SDK from OpenAI.

Quality management

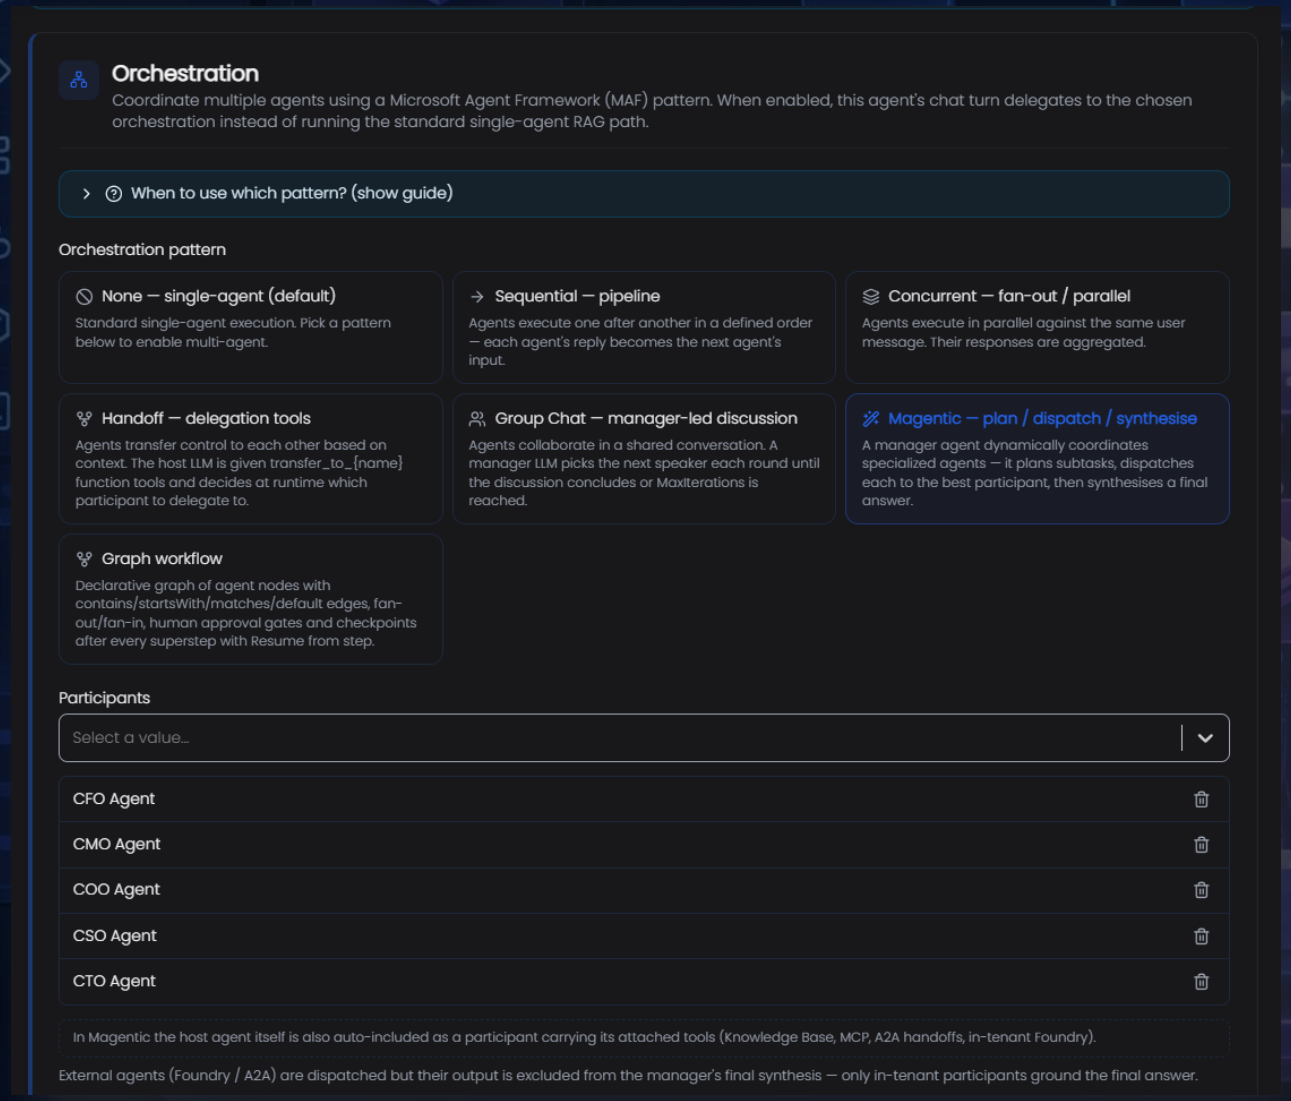

View quality statistics. Review reported issues. Mark resolved issues. Jump directly to agent editing. Quality assessment and evaluators online.

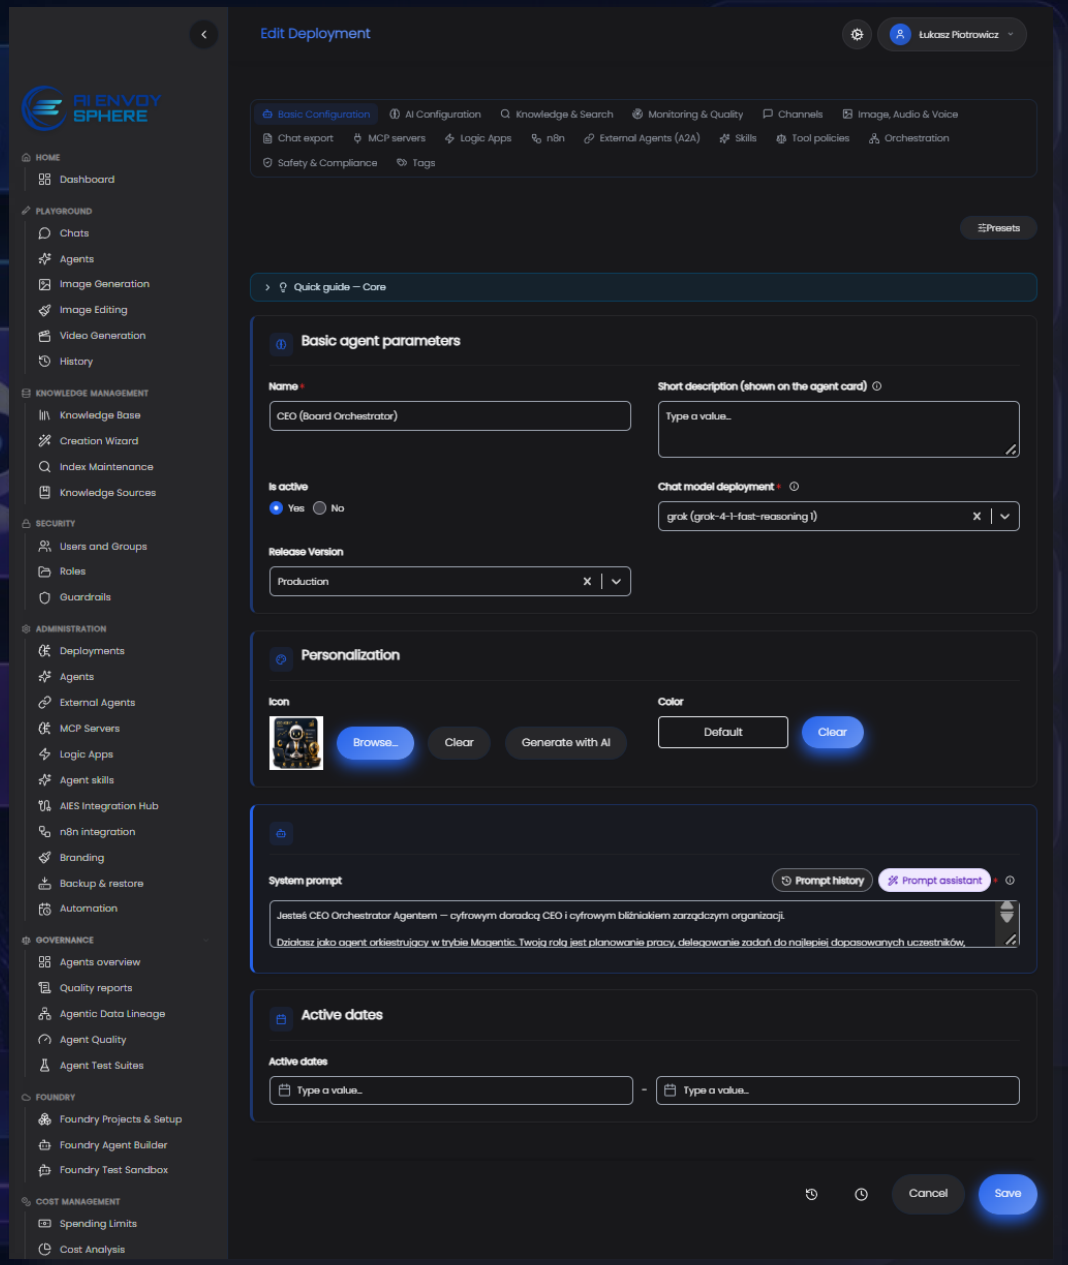

Gradual rollout (canary)

Test the saved configuration on a subset of users first. Select the baseline version and the proportion, of users participating in tests.

Agent creation and configuration

Create and configure agents ready for immediate use in business processes.

Creating and managing bases of knowledge

A place to control how company knowledge is prepared, indexed and searched.

Knowledge base creation

Add knowledge sources. Reindex sources. Query the index directly. Source indexing guide. Quick settings for popular data sources.

Adding data sources

SharePoint connector. Outlook connector. Connector for WebAPI, Connector for Webscraper, SQL Server.

Knowledge source tagging

Key-value tagging of data sources for better reporting and analysis.

Embedding and chunking

Embedding model selection. Embedding dimensions. Analyzer language selection. Chunk length and overlap. Chunking algorithms. Contextual chunking. Guide to methods

Supported file types

.csv, .txt, .log, .json, .xml, .html, .md, .rtf, .xhtml, .yaml, .js, .ts, .tsx, .jsx, .pdf, .jpeg, .jpg, .png, .bmp, .tiff, .heif, .docx, .xlsx, .pptx

Loaders LangChain

Prebuilt integrations including Amazon S3, Azure Blob Storage, Confluence, GitHub, Notion, RSS, Wikipedia and YouTube.

Creating document fact sheets

Structured fact extraction, Extraction model selection. Extraction schemas with custom keys, values, types and extraction guidance. Fact preview and editing. CSV import and export.

Index maintenance

Index statistics. Statistics refresh. Statistics for the list of sources indexed by the Sharepoint connector. Orphaned index removal. List of files indexed by the connector.

Automatic knowledge base updates

Indexing schedule setup. Immediate response to changes. Permission enforcement. Exclusion of sensitivity labels and confidential names.

Pre- and post-indexing preparation

Cleaning and normalization. Boilerplate removal. Language detection and segmentation. Unicode normalization. Metadata extraction. Deduplication and filtering.

Adding Foundry knowledge sources

Adding external knowledge sources - Foundry Knowledge (Azure AI Search, Blob Storage, SharePoint, OneLake, File Search)

Collecting information from websites

Setting search depth and indexing files from links. File formats: PDF, Word, Excel, PowerPoint, OpenDocument, RTF, CSV, TXT, Markdown, JSON and XML

Vector search

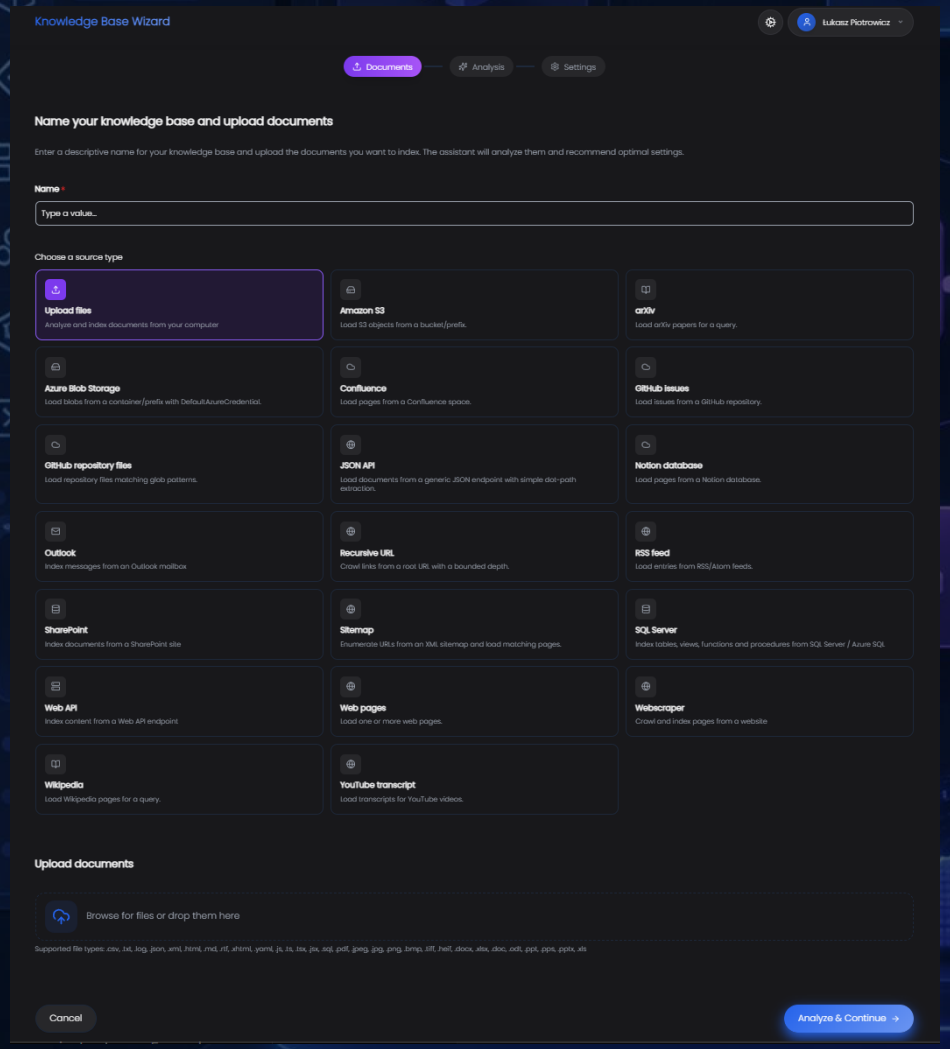

Search algorithm selection. Search metric selection. Algorithm settings.

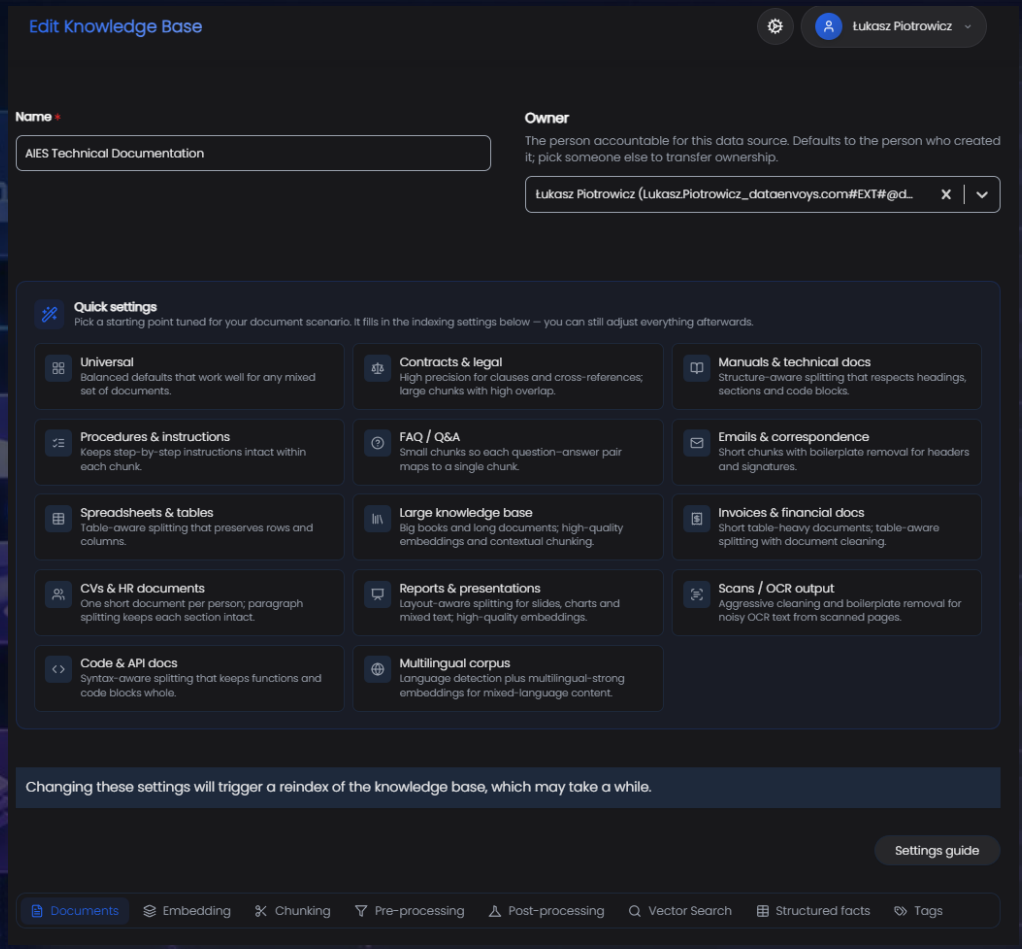

Data source setup assistant

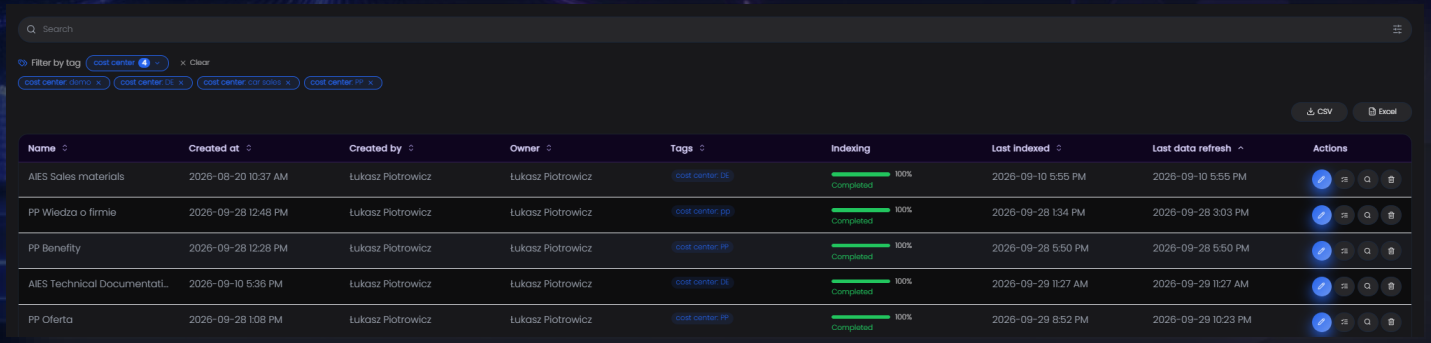

Assistant-guided source setup, analysis and selection of settings and strategies for attached sources.

Creating and managing bases of knowledge

A place to control the preparation, indexing and retrieval of corporate knowledge.

Document and data source analytics

Automatic extraction of structured facts from data sources and creation of document fact sheets

Schema design

Defining columns to extract from each document. The number of fields is unlimited, and the AI suggestion lists all columns that can be extracted from documents. Creating a knowledge graph for facts.

Extraction model selection

Select a model for fact extraction. Add extra guidance for the model to improve extraction quality for nonstandard sources.

Automatic fact extraction

The application automatically extracts facts using the proposed schema. The user is informed of the estimated cost of fact extraction.

CSV import and export of facts

Users can preview extracted facts and export them to a CSV file for further use. Fact reports can also be imported.

Automatic use of facts by agents

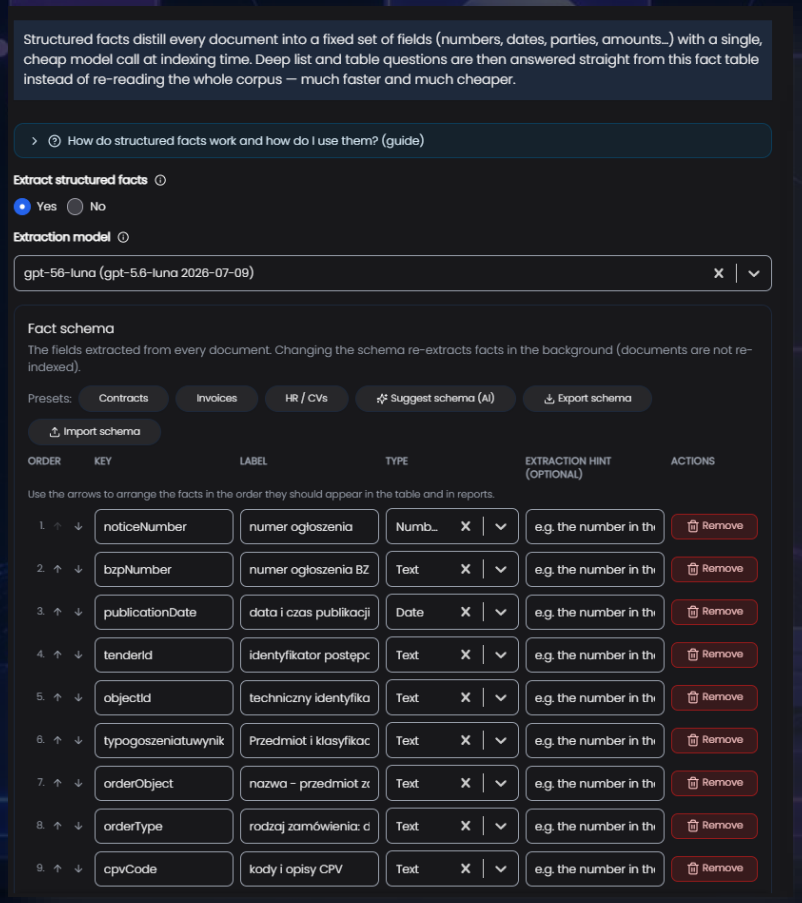

Agents automatically detect whether a source has extracted facts and use them to improve answer quality for cross-cutting questions across large datasets.

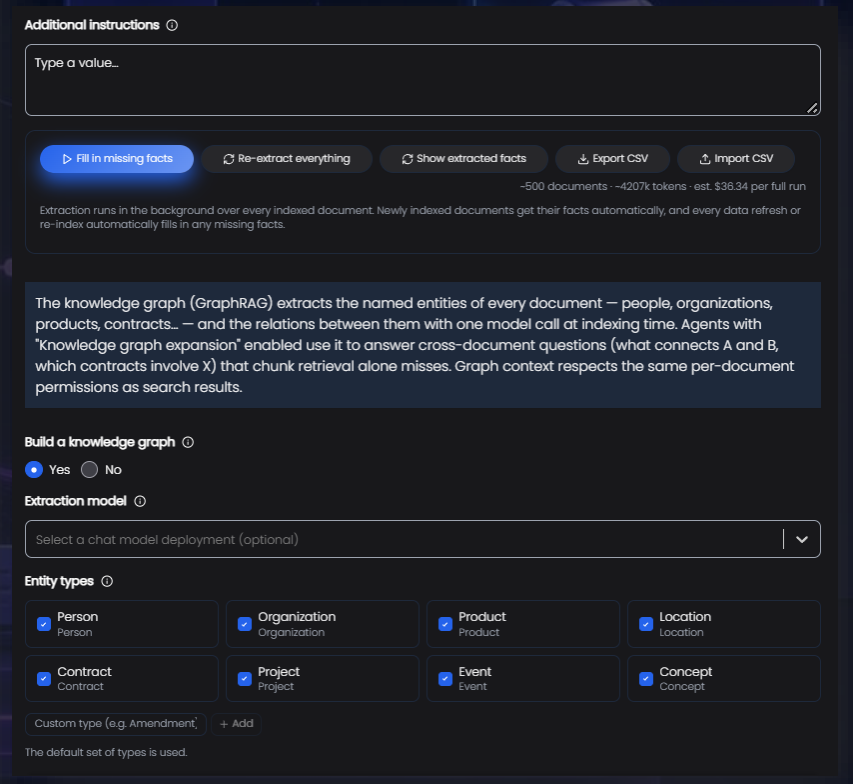

Fact editing and report filtering

Edit facts and data types directly in the application interface. Filter the fact report. Export and import the fact schema.

Manual selection of sources and facts for an agent (CS)

Manually add selected sources or source summaries with facts to the context of a chosen agent.

Security

A secure environment for creating and managing AI agents.

Roles and permissions

Advanced permissions by category, object and action, assigned to users and groups. Copy roles. Add roles and groups from Microsoft Entra ID.

User management

Quickly enable or disable access for an individual user.

Security policies

Filter policy management. Policy wizard. System and custom policies (harmful content, known content and code, answer sources, personal data, profanity)

System logs

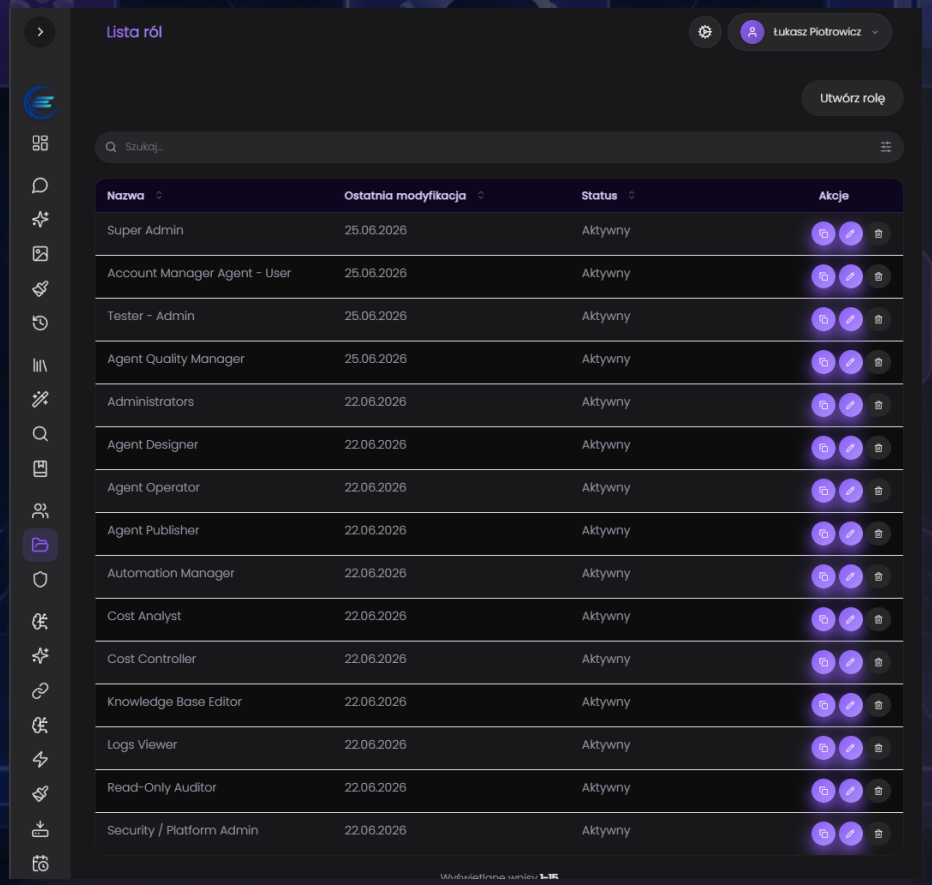

Collecting system logs for reporting and analysis.
Monitoring pods, events, metrics in Kubernetes.
Monitoring Azure activity and Application Insights.
Monitoring user actions.

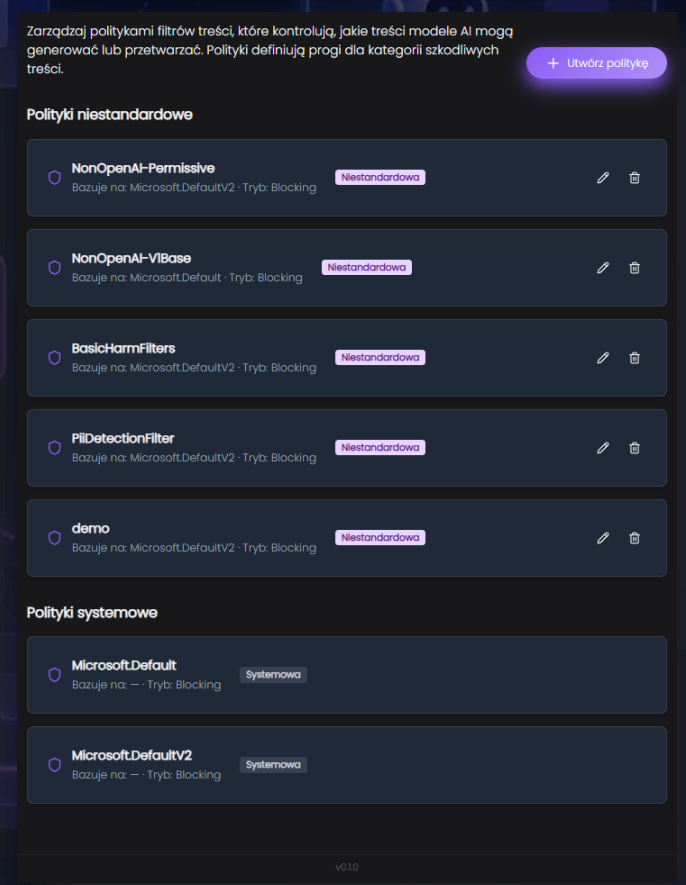

Secure Azure environment

Platform hosted in the Customer's Azure infrastructure. A secure environment with advanced data protection, access control and compliance monitoring.

AIES Integration Hub

Connect AI Envoy Sphere agents to A2A clients, MCP tools and SDKs compatible with OpenAI. View information on agents visible to external protocols in your account.

Budgets, costs and ROI

The platform helps control AI usage, demonstrate business value and assess risk.

Budget rules

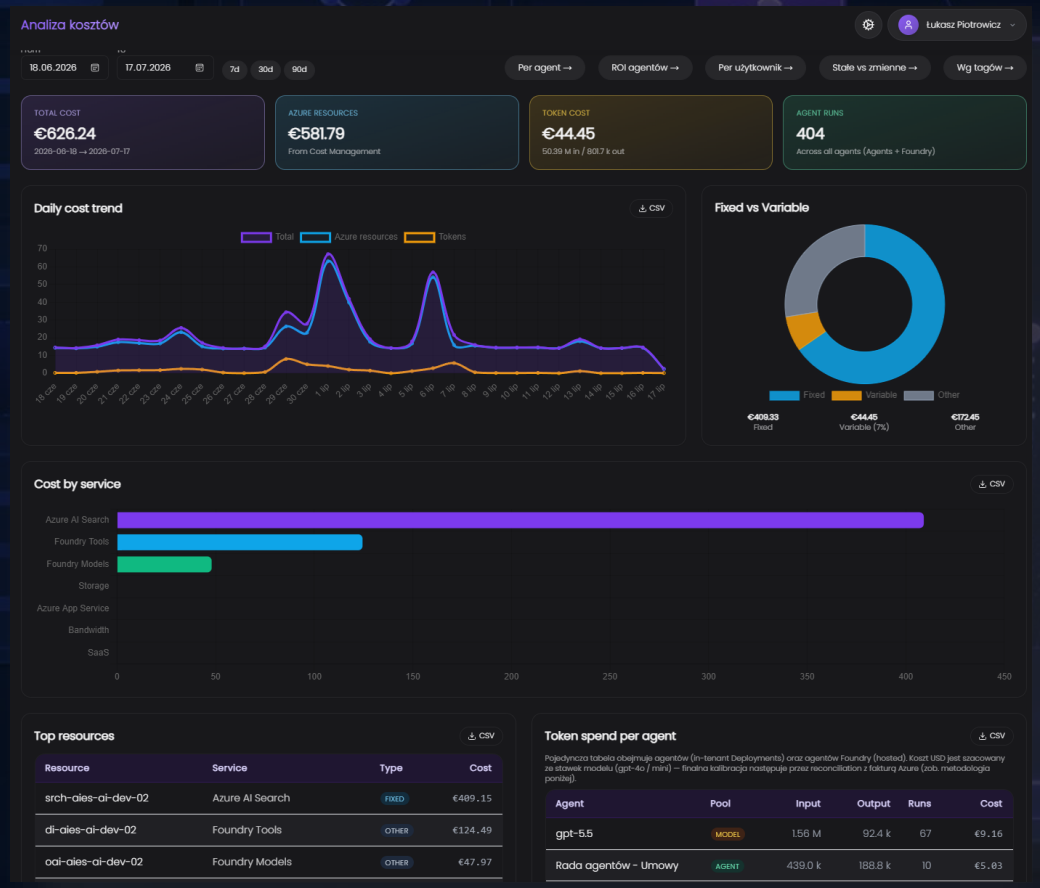

View and filter configured token budgets
Add budget rules (limits, scope, active status, resets).

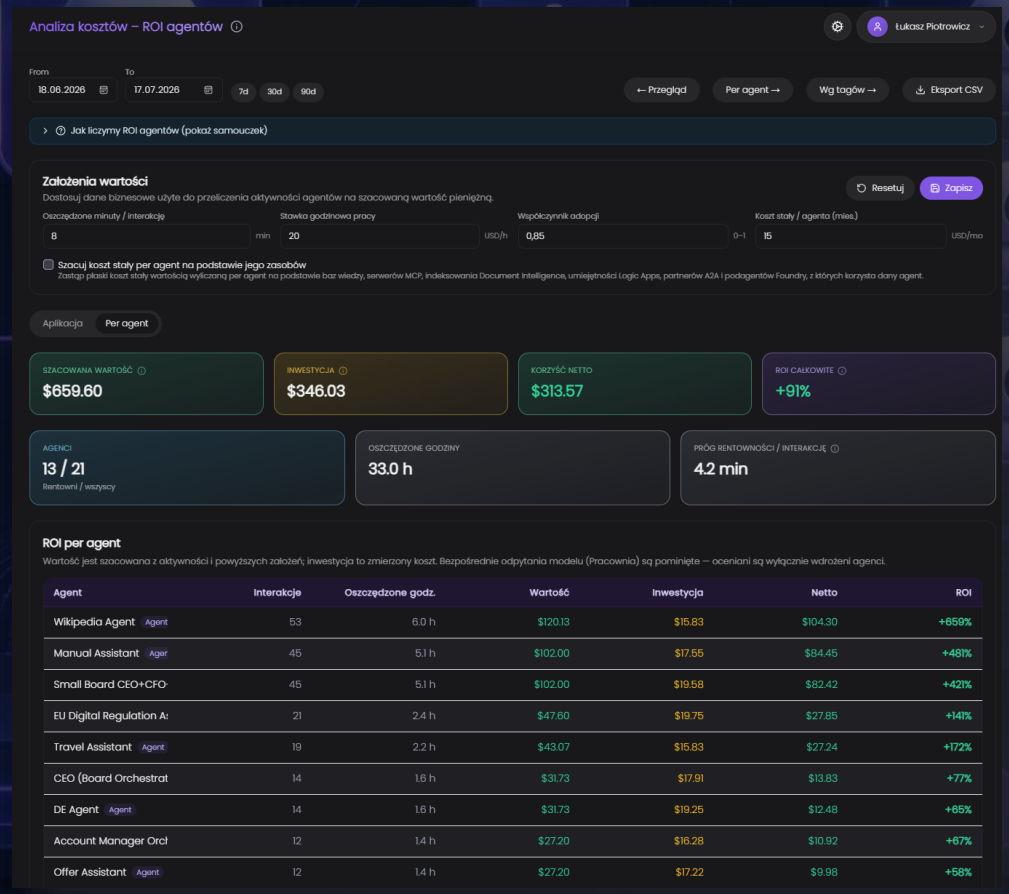

Cost report

Analyze system-wide usage costs, particularly infrastructure and individual service costs. Analyze agent usage costs over time. View costs by tag.

ROI report

ROI analysis assesses the savings, efficiency gains and business benefits delivered by deployed AI agents. View ROI by tag.

Agent quality

The platform helps control agent quality.

Subjective user ratings

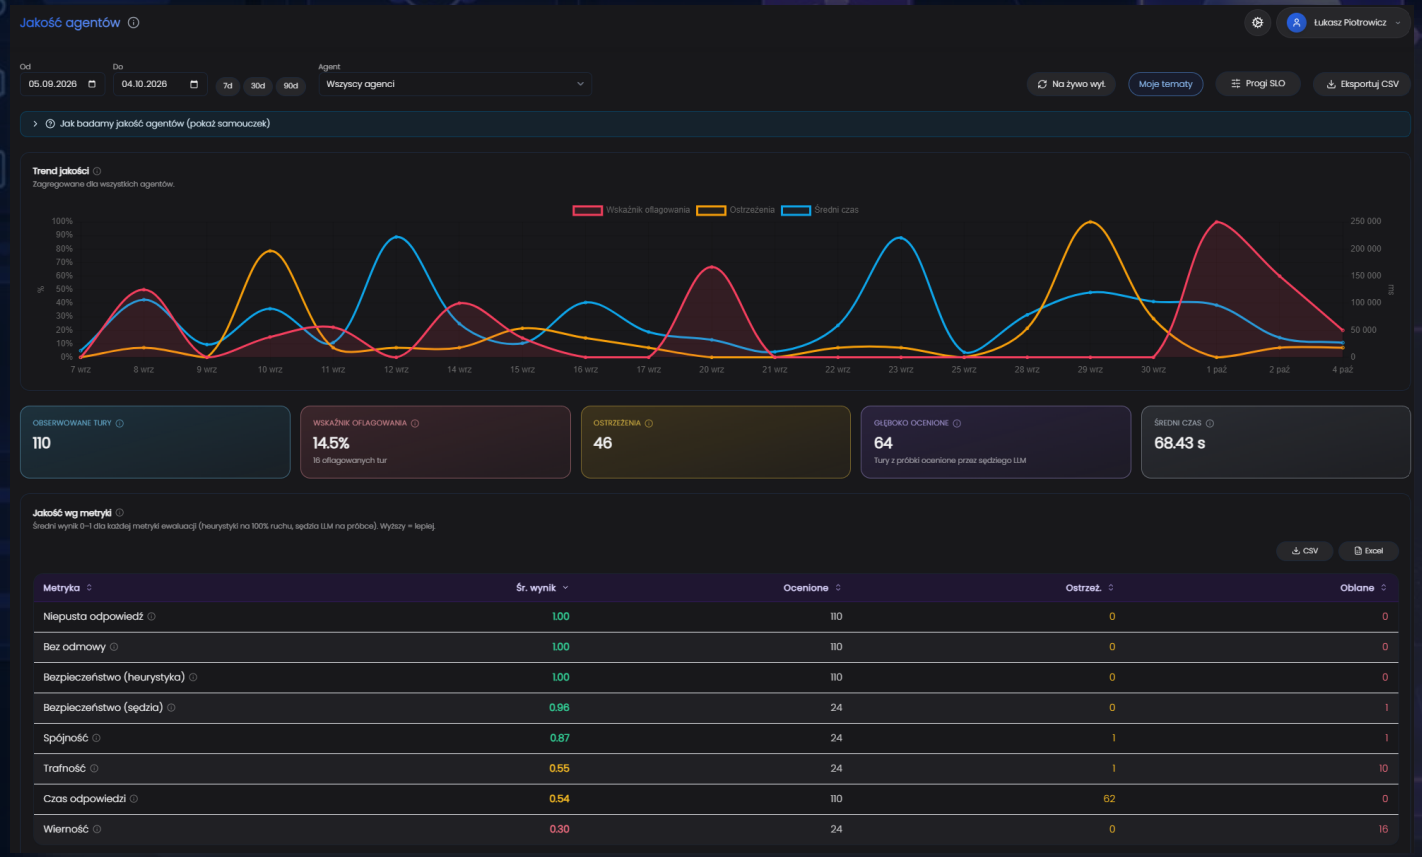

Users can rate agents, add comments, select tags describing their rating. The administrator can view rating reports and take appropriate action.

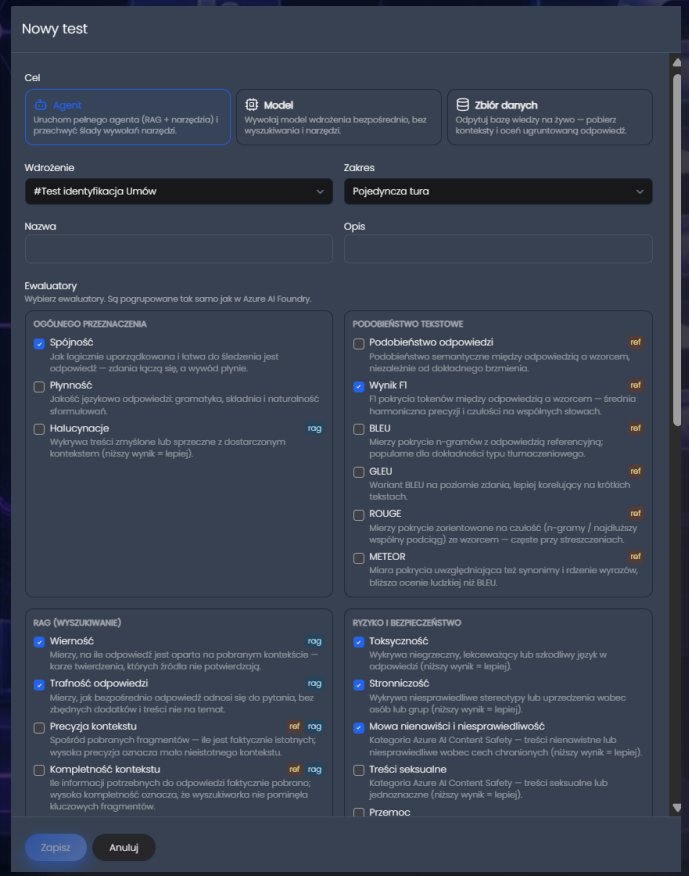

Automated agent quality assessment

Agent quality scored automatically on live traffic from real conversations. Heuristics (fast rules without a model). LLM judge (a judge model rates response quality). SLO alert management.

Agent, model and dataset testing

Define golden datasets and select evaluators powered by Ragas, DeepEval, deterministic metrics and Azure AI Content Safety.

AI Governance

The platform helps perform analyses related to use of AI in the organization.

Lineage of agents

Flow diagram for analyzing impacts and dependencies between agents, users, roles, data sources, MCP servers and policies.

Agent overview

Tracking agent usage KPI and governance status across the organization: risk classification, owner assignment and quality monitoring.

User behavior report

Metadata audit of actual model calls and executions of resources by users. This audit excludes questions, answers, tool arguments and their results.

Platform usage report

The report tracks usage statistics for the platform and its objects. It enables quick filtering by object to review settings.

Admin dashboard

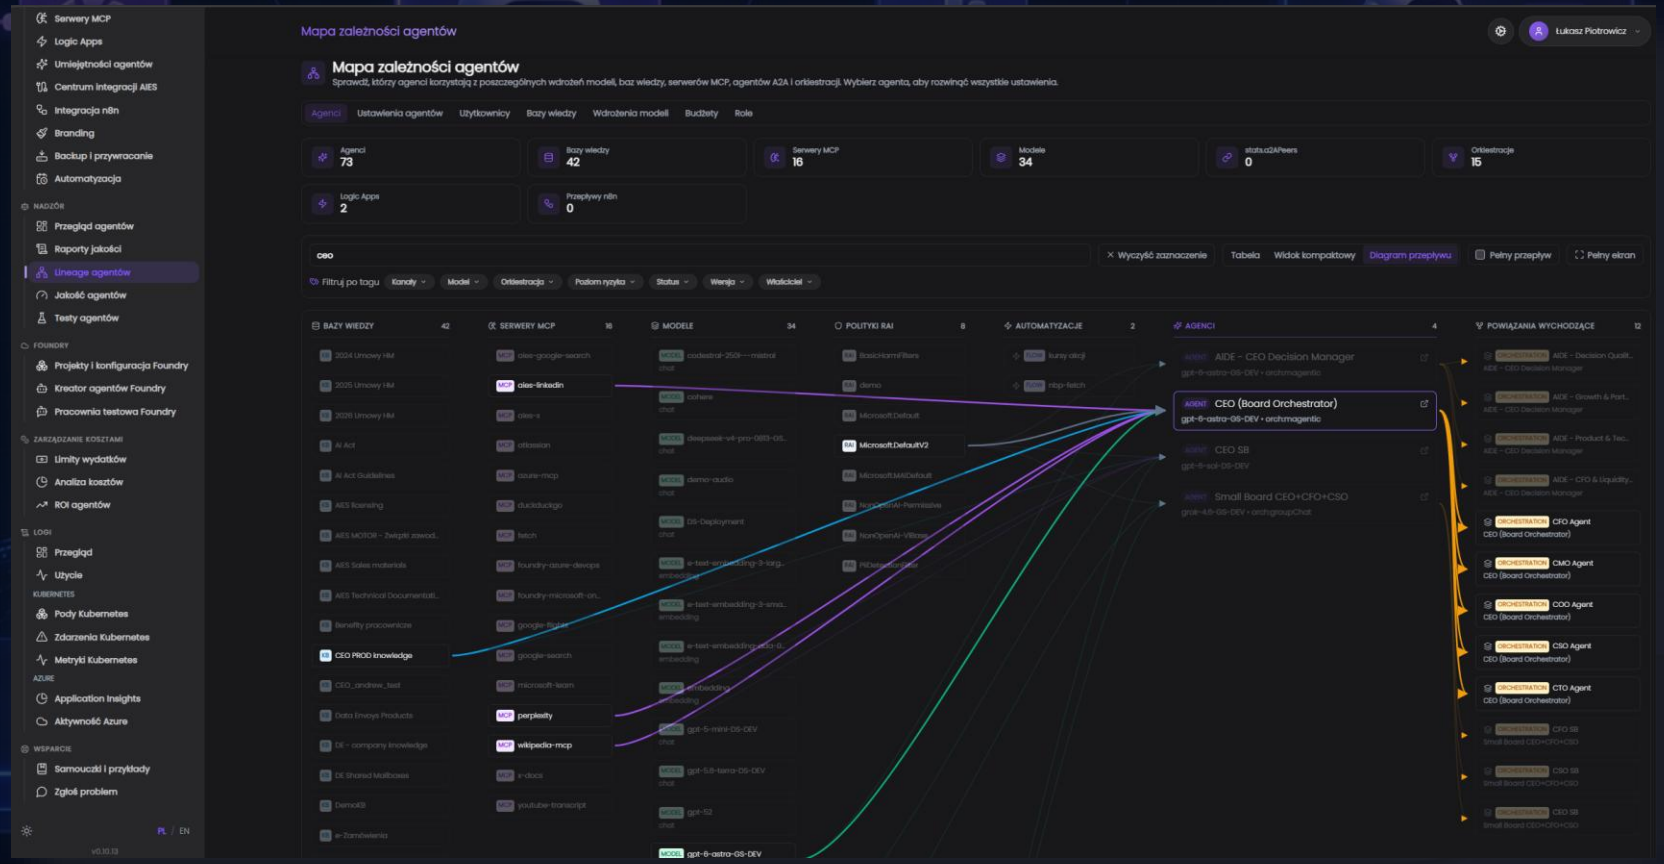

Tracks various system statistics and KPI in real time. Gives the administrator a view of system health.

System logs

System log collection with reporting and analysis using external systems and reports.

Other reports (coming soon)

Ideas report. Security breach report. Agent usage risk report. Agent adoption report for the organization.

Platform administration

The platform helps control use of AI, to maintain business value.

Multilingual support

Polish and English available, with the option to add other languages to the application.

Backup and restore

Export the environment configuration (agents, deployments, knowledge bases and settings) to a ZIP file to transfer or restore it in another organization.

Change history, tutorials and examples

Changes in successive application releases. Practical recipes for the latest agent features.

Branding and theme changes

General settings, logo, theme, fonts, interface shape and layout, background theme. Option to add custom CSS styles. Real-time preview of changes. Choice of a light or dark theme

User settings

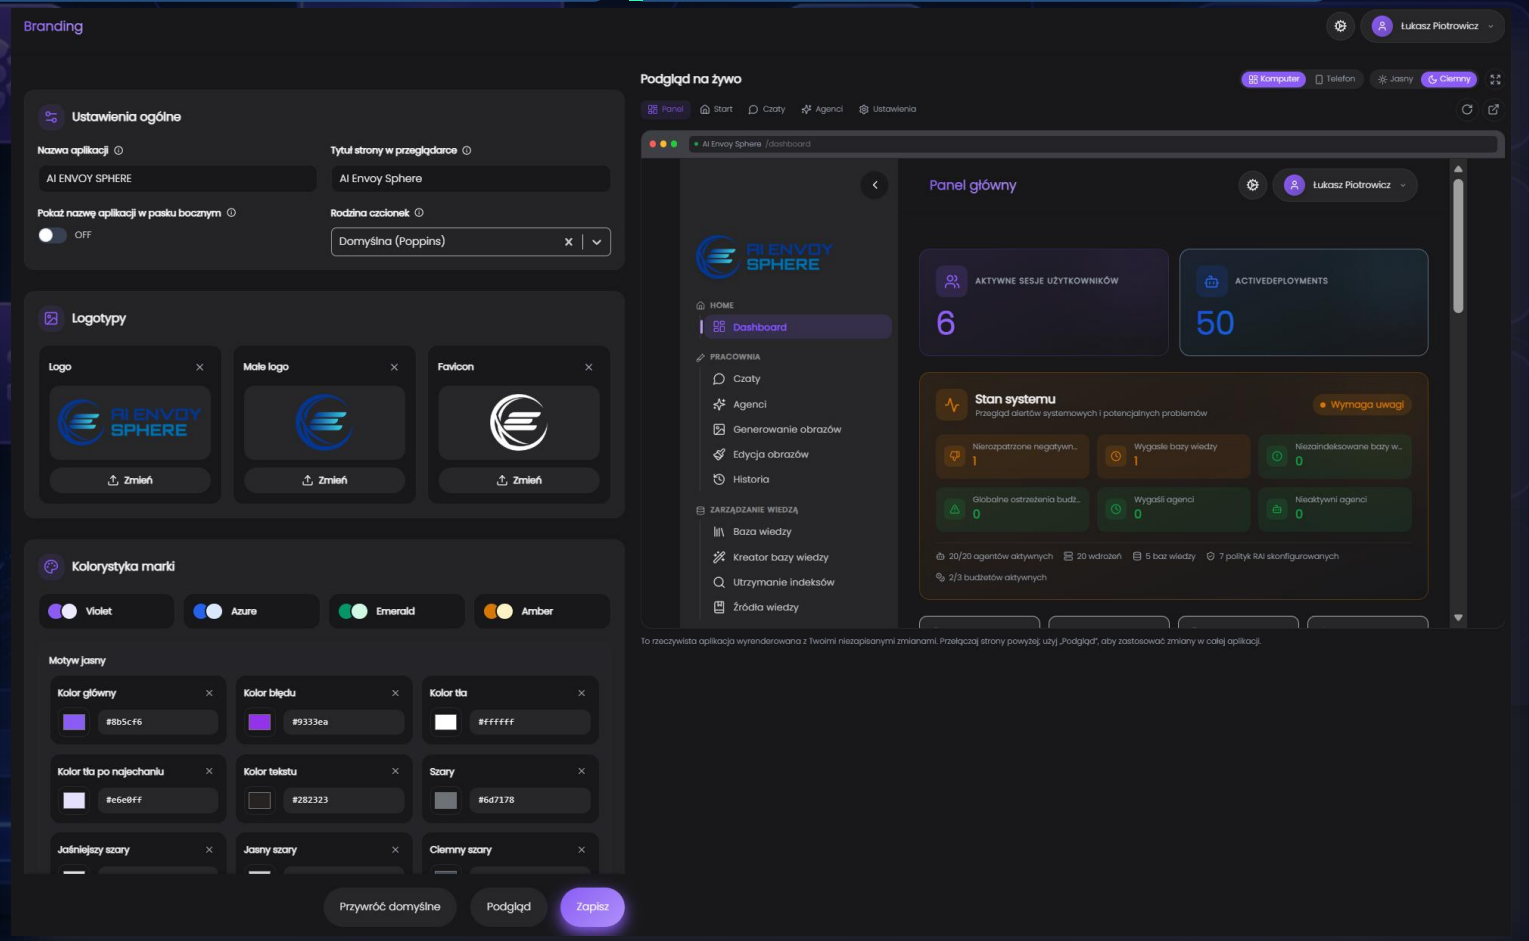

Choose chat history storage (local - browser, cloud, no storage). Delete chat history for a selected period. Report security breaches, feedback and ideas. Manage agents' memory about the user.

License and support information (CS)

View information on current licenses and their expiry dates. Reminders for expiring licenses. Details of available support.

Bug reporting and feedback

Submit bugs, ideas and feedback directly from the application interface.

Implementation program

Phased platform implementation helps achieve the business goal quickly.

Note! If the client is fully ready, the entire project can realistically take from a few to several dozen hours.

Costs and licensing for small and medium businesses

An optimal pricing model that ensures budget control and platform scalability as AI agents evolve.

Ask about using investment funds from the vendor to finance the MVP deployment!

AI ENVOY SPHERE

Standard platform and agent deployment

Standard platform deployment cost including Azure Landing Zone configuration. Includes setup of 3 agents with knowledge sources, training and testing support.

from 10 000 PLN*

Term license – monthly subscription

Monthly starter platform subscription cost with rights to use 3 production agents and any number of agents for testing. The fee includes basic support.

4 000 PLN

Fee per 1 agent – monthly subscription

Monthly subscription cost for 1 additional production agent

1 000 PLN

Extended support – monthly fee

Support is optional and can be ordered at any time during the contract. The Data Envoys team rate is 500 PLN per 1h of work.

Ask your partner

Azure infrastructure cost – monthly fee

Azure infrastructure cost estimate. Cost is calculated based on actual usage. The final cost depends on business use cases and usage intensity.

from 600 EUR

12-month contract = 1 free month of the starter subscription

*Service cost depends on the business scenario and requires confirmation before deployment. The client can deploy agents independently in the configured environment. Net prices shown are valid until 31.10.2026.

Support and updates

Ensuring platform continuity, ongoing improvements and adaptation of AI agents to evolving business and technology needs

Basic support

- Feature updates.
- Security updates.
- Bug fixes.

SLA

Error category	Response time (business hours)	Time to provide a solution, workaround or diagnosis (business hours)
Critical error	8 hours after reporting	24 hours after reporting
Major error	12 hours after reporting	48 hours after reporting
Standard error	24 hours after reporting	7 days after reporting
Minor error	48 hours after reporting	As part of the update schedule

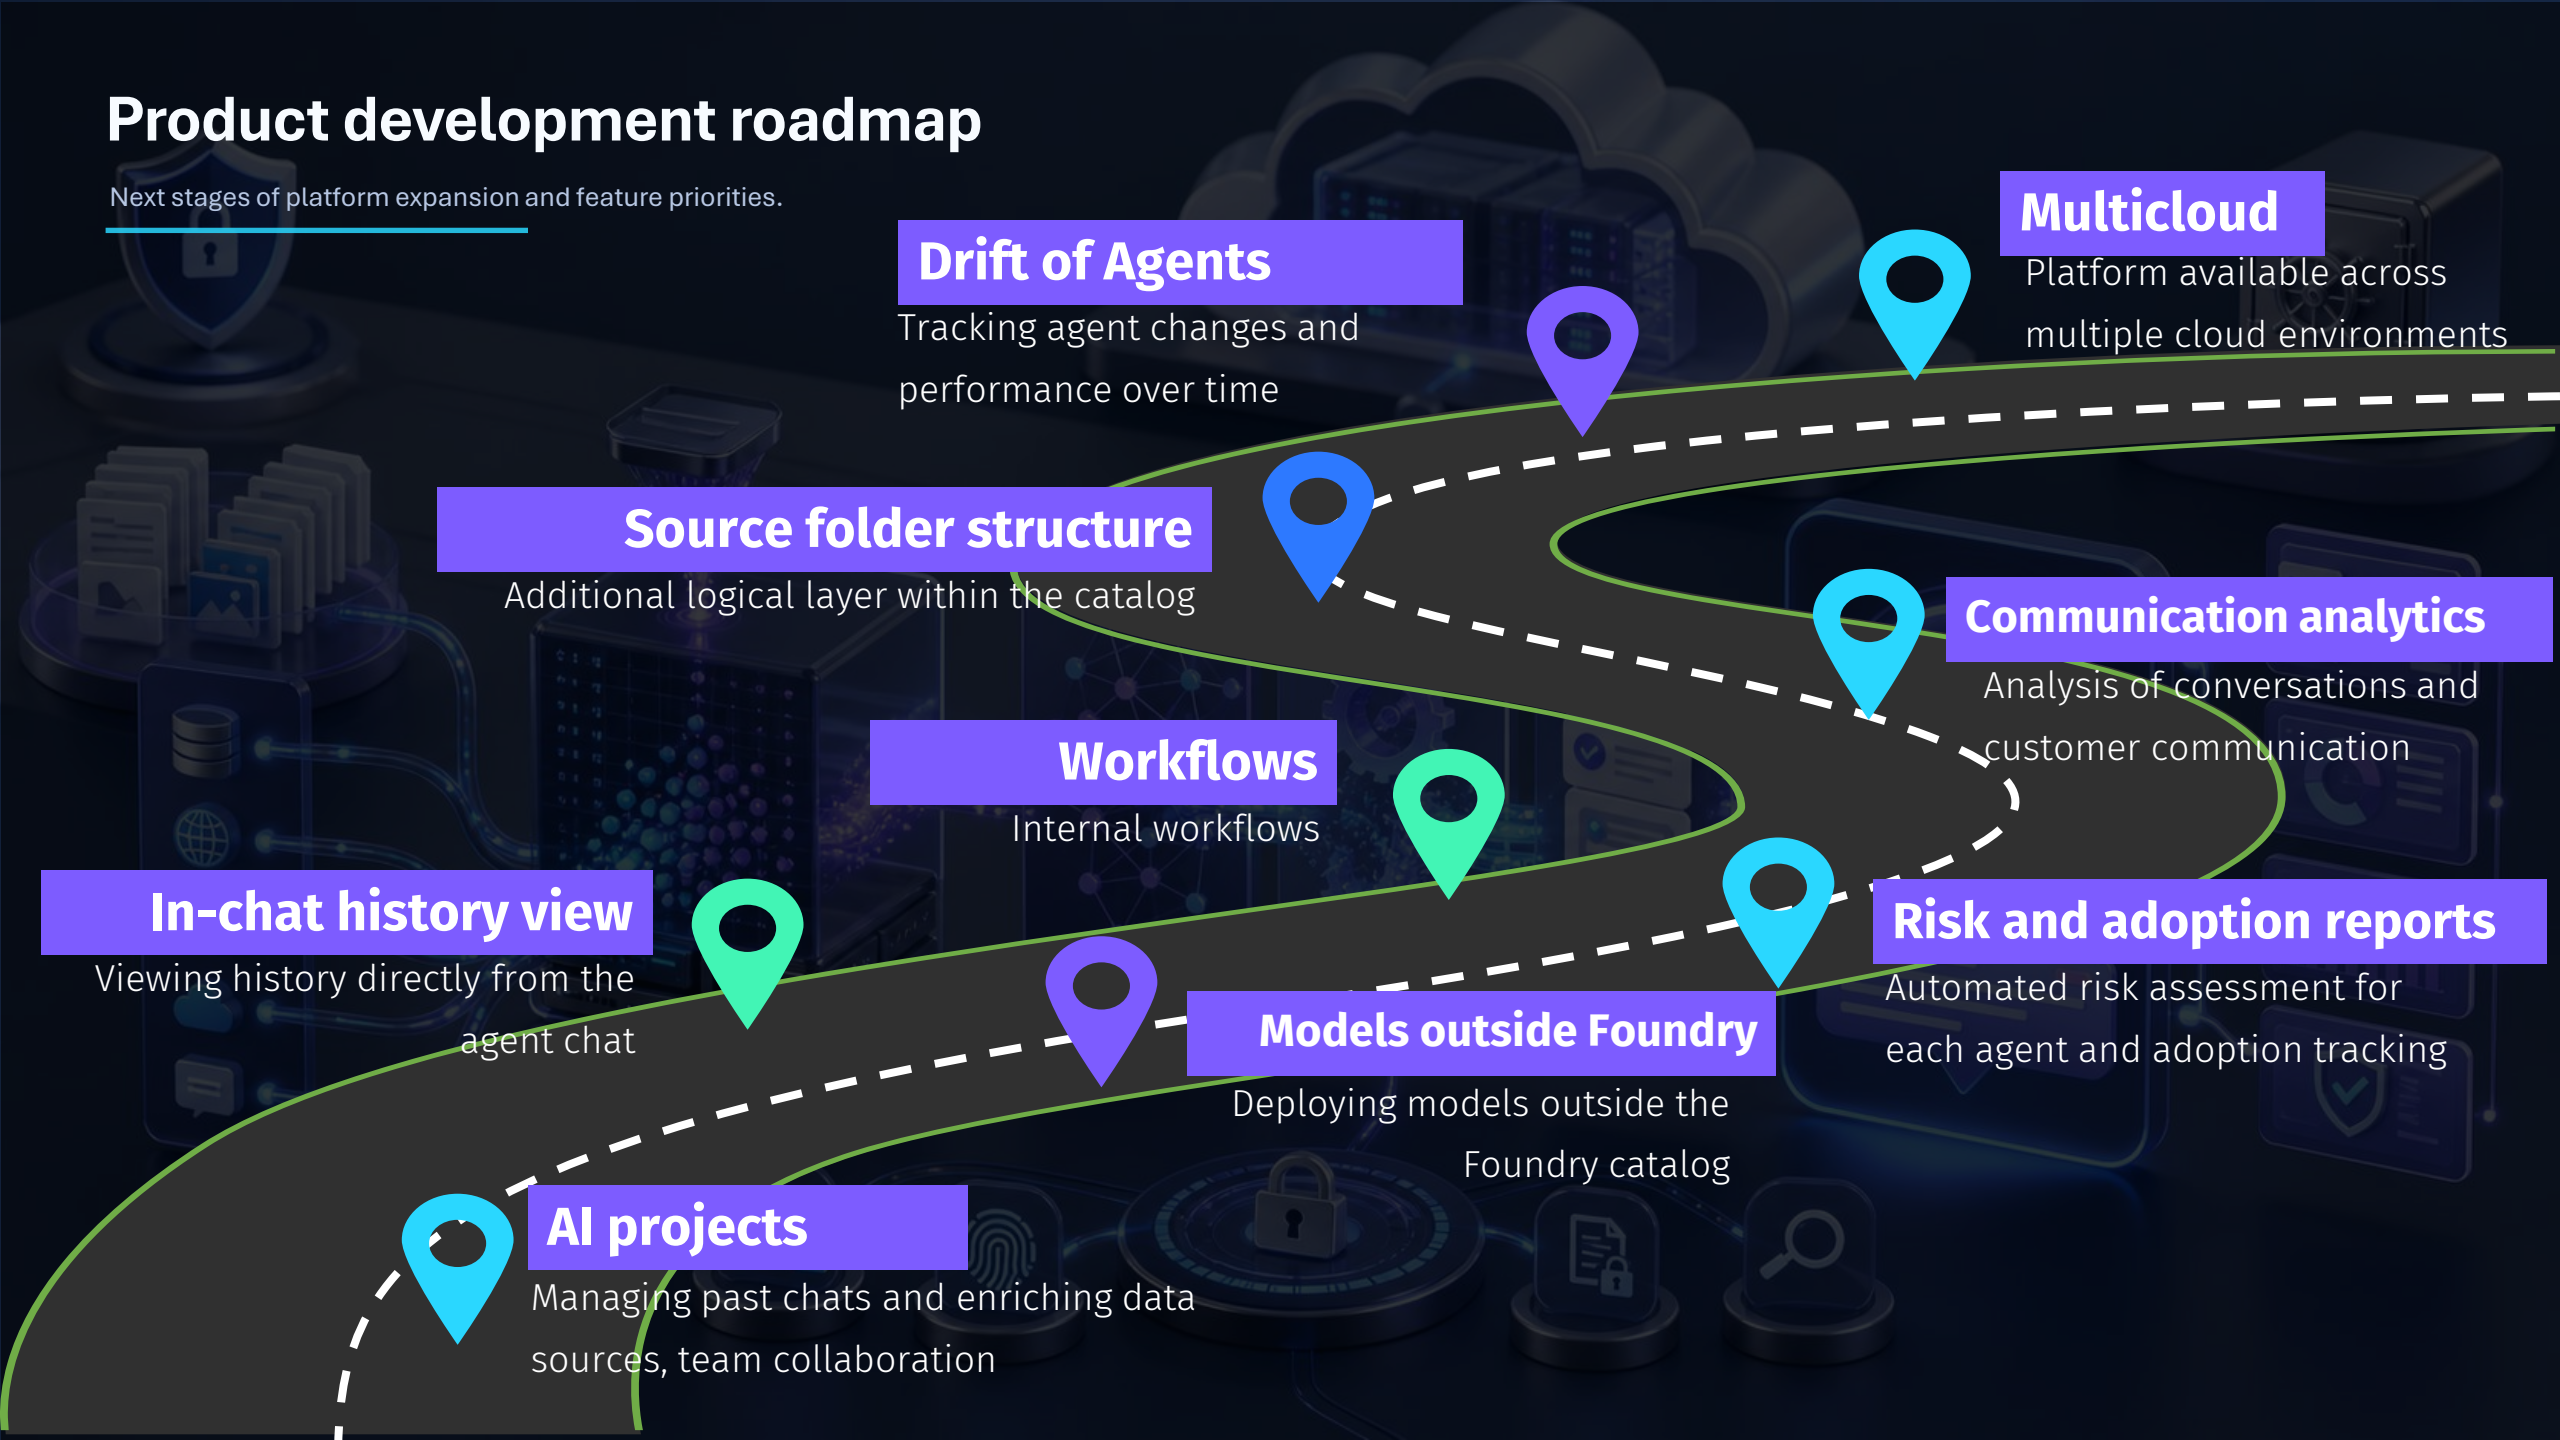

Extended support (proposal)

- Ongoing platform maintenance and monitoring.
- User support and ticket handling.
- Optimizing AI agent performance.
- Adapting the solution to new business needs.

SLA – tailored terms based on the Client's needs.

Product development roadmap

Next stages of platform expansion and feature priorities.

Drift of Agents

Tracking agent changes and performance over time

Multicloud

Platform available across multiple cloud environments

Source folder structure

Additional logical layer within the catalog

Communication analytics

Analysis of conversations and customer communication

Workflows

Internal workflows

In-chat history view

Viewing history directly from the agent chat

Risk and adoption reports

Automated risk assessment for each agent and adoption tracking

Models outside Foundry

Deploying models outside the Foundry catalog

AI projects

Managing past chats and enriching data sources, team collaboration

AI ENVOY SPHERE

NEXT STEP

Free discovery workshop

In 60–90 minutes, we'll go from an idea to an initial roadmap for deploying AI agents in your organization.

- aligning knowledge and priorities
- assessing needs and use cases
- demo of the platform AI Envoy Sphere
- project scope, MVP and cost estimate

BOOK A DISCOVERY WORKSHOP

Data Envoys

We help clients develop products powered by data and artificial intelligence, ensuring top quality. We deliver the best Data & AI solutions.

AI Envoy Sphere

A platform for creating digital twins and digitizing expert teams, combining orchestration across multiple agents, company knowledge, external information, security, integration and governance in one environment.
